SOFTWARE REQUIREMENTS SPECIFICATION

ORGAN DONOR AND FINDER WEBSITE

Student Name	BHUVANA .P	**Register Number**	111626111021
College	R.M.K. College of Engineering and Technology	**Course**	Fundamentals of Full Stack

1. Introduction

The Organ Donor and Finder Website is an educational front-end concept designed to share introductory information about organ donation and direct visitors toward authorised sources of guidance. It demonstrates basic webpage development using HTML and CSS. It is not a medical service and does not match donors with recipients.

1.1 Purpose

This Software Requirements Specification (SRS) records the purpose, scope, users, features, operating environment, and quality requirements for the proposed student mini project.

1.2 Scope

The website contains an introduction to organ donation, general educational information, a short process guide, frequently asked questions, and a sample contact form. Real registration and medical questions must be handled by authorised healthcare or government organisations. The demo does not register donors, determine eligibility, match recipients, or process organ transactions.

1.3 Objectives

• Present clear introductory information about organ donation.
• Encourage visitors to seek guidance from qualified healthcare professionals and official organisations.
• Demonstrate a simple enquiry form layout without collecting data.
• Practise semantic HTML, separate CSS, responsive design, and accessible labels.

2. Overall Description

Product perspective: a standalone static website that runs in a modern browser. It may be extended for learning, but real donation and transplantation processes must remain within authorised medical systems.

User classes: (1) visitors seeking general awareness; (2) people looking for official registration guidance; and (3) the student developer who maintains the webpage.

2.1 Operating Environment

Hardware: computer, tablet, or smartphone. Software: Chrome, Edge, Firefox, or another modern browser, plus a text editor such as Visual Studio Code. A server or database is not required for this prototype.

3. Functional Requirements

ID	Feature	Expected behaviour
FR-01	Home section	Show the site name, purpose, and navigation links.
FR-02	Education section	Present introductory information and common questions about donation.
FR-03	Guidance	Direct visitors to authorised healthcare professionals and official sources.
FR-04	Enquiry form	Provide name, email, topic, and message fields; do not send or save submissions.
FR-05	Responsive layout	Adapt content to desktop and mobile screens using CSS.

4. Non-Functional Requirements

• Usability: clear headings, navigation, and simple language.
• Performance: the static webpage should load quickly on ordinary devices.
• Compatibility: support recent common browsers.
• Maintainability: store HTML and CSS in separate files.
• Accessibility: use meaningful headings, labels, keyboard focus indicators, and readable contrast.
• Privacy: do not collect or transmit personal or medical information.

5. Constraints and Assumptions

This project uses HTML and CSS with a small demonstration interaction. It has no database, secure account system, medical screening, or live donor directory. Its content is educational and is not medical advice. Visitors should contact qualified professionals and authorised organisations for real-world decisions.

6. Future Enhancements

Possible learning extensions include multilingual educational content, a searchable FAQ, verified official-resource links, and an information management section. Any real donor registration or matching system would require authorised clinical oversight, security review, privacy safeguards, and compliance with applicable laws.

7. Acceptance Criteria

The project is complete when the SRS PDF contains exactly two pages, index.html opens in a browser, style.css is linked correctly, navigation links work, the layout adapts to small screens, and the form clearly states that it is only a demo.

8. Conclusion

This project demonstrates basic planning and front-end presentation for an organ donation information website while keeping real medical decisions and donor-recipient processes with authorised professionals and organisations.
